

Compliance support for inventory of hazardous material

– Facilitating the tracking of potential hazardous material on board vessels

Improved compliance

Reduced administrative cost

Safer environment

To prevent pollution and health risks, particularly in anticipation of vessel's end of life, the IMO has adopted a resolution about Inventory of Hazardous Material (IHM). Each vessel is legally responsible for declaring and maintaining an up-to-date inventory of all materials contained in the ship's structure and equipment, throughout its operational life. This enables them to identify & manage equipment with hazardous material. Alfa Laval supports its customers not only in staying compliant by providing an exhaustive list of the material shipped to the vessel but also by controlling & avoiding the use of hazardous material.

"Great to see that Alfa Laval have a good system for managing hazardous materials, this is just what we need. We believe suppliers who have control of their hazardous materials and work towards decreasing their use will have competitive advantage going forward." – Krister Bendiksen, Head of Procurement Ship Management, Odfjell
