Commissioning sampling for ballast water treatment systems

Understanding the purpose and implementation

November 2020

Updated according to IMO MEPC 75
Introduction

Water sampling in connection with commissioning testing – more simply expressed as commissioning sampling – is being introduced for newly installed ballast water treatment systems. The IMO requirement was laid out at MEPC 74 in an amendment to the International Convention for the Control and Management of Ships’ Ballast Water and Sediments (BWM Convention).

At present, commissioning sampling is not mandatory for the vast majority of vessels. Nor will it become a global requirement before 1 June 2022. Nonetheless, there is already immense confusion on the market regarding the purpose and procedures for it.

This paper clarifies the new requirement, explaining not only what commissioning sampling is, but also why, how and when it should be done.

New decisions from MEPC 75
This paper was originally published in May 2020, when a number of factors related to commissioning sampling were uncertain. The information in this updated edition reflects the final decisions made at MEPC 75.
The commissioning sampling regulation

In fact, a demand to perform water sampling as part of ballast water treatment system commissioning first arose with Resolution A.1120(40) under the Harmonized System of Survey and Certification (HSSC). The demand was not part of the BWM Convention, however, which is why it was addressed at the MEPC 74 meeting in May 2019. There it was approved as a draft amendment to Regulation E-1 of the BWM Convention, which was adopted at the MEPC 75 meeting in November 2020.

The amendment requires sampling to take place as part of the operational testing of the ballast water treatment system once the installation is complete and finalized. The sampling is to be performed according to BWM.2/Circ.70/Rev.1, Guidance for the commissioning testing of ballast water management systems.

The amendment will enter into force in 1 June 2022. Although the MEPC encourages flag states to implement the requirement today, only a handful have chosen to do this so far. (See later section, Implementation of commissioning sampling.)

- Amendment to BWM Convention Regulation E-1 adopted at MEPC 75
- Entry into force 1 June 2022
- Voluntary implementation encouraged
What commissioning sampling is – and is not

Commissioning sampling is a response to demands from the market. Shipowners have requested proof that their installed ballast water treatment systems will perform according to type approval and meet the IMO D-2 discharge standard. It is important, however, to understand what commissioning sampling actually validates.

Commissioning sampling does not validate the ballast water treatment solution as such. That validation is provided by the type approval, which is an approval of the standard ballast water treatment system design. The design itself has already been shown to meet the IMO D-2 discharge standard – so this is not in question.

Rather, commissioning sampling shows that the specific installed system replicates the performance defined in the type approval. It is a tool for spotting deviation from the type-approved performance, perhaps caused by a manufacturing defect or an installation error. The sampling is part of the wider commissioning testing that ensures all mechanical, physical, chemical and biological processes are working properly within the system.

The sampling and the testing as a whole are overseen by the flag state or by a classification society authorized by the flag state, to whom any discrepancies must be reported.

- Indicates performance according to IMO D-2 but not part of type approval
- Shows that a specific installed system replicates the performance defined by its type approval
The commissioning sampling procedure

Commissioning sampling is a straightforward procedure that is defined step-by-step in BWM.2/Circ.70/Rev.1, Guidance for the commissioning testing of ballast water management systems. Local ambient water should be used, and the steps can be summarized as follows.

- **Sampling of ambient water (optional)**
  To characterize the ambient water, a sample may be collected during ballast water uptake. This can be done by any means practical, e.g. using an inline sample port or taking a sample directly from the harbour. An indicative analysis is sufficient to characterize the ambient water, so no detailed analysis of the uptake water is required.

- **Sampling of ballast water discharge**
  A sample of the ballast water discharge should be collected after full treatment has been applied, in accordance with the Guidelines on ballast water sampling (G2). The sample should be representative of the whole discharge of ballast water from any single tank or combination of tanks being discharged. It should be collected as close as possible to the overboard discharge point and during ballast water discharge whenever feasible.

- **Evaluation of compliance with IMO D-2**
  The respective samples should be analysed to confirm ballast water treatment performance that indicates compliance with the IMO D-2 discharge standard. Using reliable and accurate indicative* analysis methods, the size classes included in the standard need to be evaluated:
  - Organisms ≥50 µm
  - Organisms ≥10 µm and <50 µm

  * Note that none of the indicative methods defined in Table 3 of BWM.2/Circ.42/Rev.2 have been fully evaluated thus far. Because the specified indicative methods are not yet validated, test organizations may instead recommend detailed methods they know to be reliable and accurate.

- **Reporting**
  The sampling methods and analysis results should be documented for the flag state administration or the classification society authorized by the flag state as part of the written report on the wider commissioning testing.

Ambient water should always be used
Commissioning testing – and thus commissioning sampling – is to be done using local ambient water. The ambient water should be accepted for testing regardless of the level of challenge it poses to the ballast water treatment system. This has implications that are discussed in the next section of this white paper, Considering System Design Limitations.
Considering System Design Limitations

As part of the wider commissioning testing, BWM.2/Circ.70/Rev.1 also requires an assessment of the ballast water treatment system’s applicable self-monitoring parameters, e.g. flow rate, pressure, TRO and UV intensity. Not only should the correct operation of all sensors and related equipment be confirmed, the so-called System Design Limitations (SDL) of the ballast water treatment system should be considered. Possible limitations include minimum holding time, salinity requirements and UV transmittance or intensity values.

According to the guidance, the ambient water should be accepted for testing regardless of the challenge it poses to the ballast water treatment system, i.e. whether or not it falls outside the system’s SDL. Depending on the individual system and its underlying treatment technology, low salinity or low UV transmittance could make the ambient water inappropriate for operational testing.

In cases where the ambient water is deemed inappropriate, it is up to the flag state to decide the course of action. The guidance states that the testing should be evaluated to the satisfaction of the flag state administration, but it remains to be seen how most flag states will deal with this in practice. A likely scenario is that flag states will require testing in more appropriate conditions after the vessel has left the yard. In this event, a short-term International BWM Certificate with a Condition of Authority would be issued, requiring testing within 2–3 months.

- Ambient water to be accepted for testing, even if it falls outside system SDL
- Flag state determines course of action if the ambient water is inappropriate for the system
Implementation of commissioning sampling

As stated earlier, the draft amendment to Regulation E-1 of the BWM Convention will enter into force on 1 June 2022. Until that time, there is no global requirement to perform commissioning sampling. However, the MEPC encourages flag state administrations to begin implementing the procedure as soon as possible, which has led to confusion in the market.

As of June 2020, only a handful of flag states have chosen to implement the amendment proactively. Australia, Cyprus, Greece and Singapore have issued circulars that make commissioning sampling mandatory for ballast water treatment systems on vessels with their respective flags. The Bahamas, Liberia and Panama also request commissioning sampling, although the procedure remains non-mandatory in these countries.

It is expected that other flag states will follow. However, it is only vessels flagged in these countries that must perform commissioning sampling at present. For vessels carrying any other flag, commissioning sampling is not necessary at this time.

- Not globally required until entry into force (1 June 2022)
- Currently required by a few flag states implementing early – only vessels with these flags affected
Responsibilities associated with commissioning sampling

If commissioning sampling is required by a vessel’s flag state, it is the shipowner who is responsible for contacting and making arrangements with an appropriate testing body. As the sampling is not a direct part of the commissioning work, managing it does not fall within the standard commissioning scope of the system supplier.

Likewise, the supplier’s commissioning scope does not include the fault-finding, corrective actions and new sampling required if the first samples fail to indicate compliance with the IMO D-2 discharge standard. There may be many possible reasons for a negative result, including failure to clean the ballast water tanks and piping appropriately prior to installation.

The actual collection and analysis of representative samples must be performed independently, i.e. without the supplier’s involvement, and to the satisfaction of the flag state administration. However, the guidance does not prevent the supplier from offering assistance by arranging for third-party sampling and analysis outside the standard commissioning scope.

For shipowners installing Alfa Laval PureBallast 3

Alfa Laval stays up to date with marine legislation and related developments, including the implementation of commissioning sampling. When installing Alfa Laval PureBallast 3 on vessels flagged in applicable states, shipowners should contact their Alfa Laval representative to discuss commissioning sampling before they contact a testing body.
This is Alfa Laval

Alfa Laval is active in the areas of Energy, Marine, and Food & Water, offering its expertise, products, and service to a wide range of industries in some 100 countries. The company is committed to optimizing processes, creating responsible growth, and driving progress – always going the extra mile to support customers in achieving their business goals and sustainability targets.

Alfa Laval’s innovative technologies are dedicated to purifying, refining, and reusing materials, promoting more responsible use of natural resources. They contribute to improved energy efficiency and heat recovery, better water treatment, and reduced emissions. Thereby, Alfa Laval is not only accelerating success for its customers, but also for people and the planet. Making the world better, every day. It’s all about Advancing better™.

How to contact Alfa Laval

Contact details for all countries are continually updated on our web site. Please visit www.alfalaval.com to access the information.
