Alfa Laval SB Anti Vacuum Valve

Introduction
The Alfa Laval SB Anti Vacuum Valve is a compact safety valve that protects tanks from collapse or implosion due to internal vacuum conditions. These conditions occur during emptying, cool-rinsing after hot-cleaning, or caustic cleaning in a CO₂ atmosphere. The compact, easy-to-clean safety valve fits onto any closed process tank, optimizing the personnel safety, reliability and performance of critical processes and maximizing uptime.

Application
This safety valve is designed for use in hygienic processes in the brewery, dairy, food, beverage and many other industries.

Benefits
- Greater process safety
- Low initial cost of investment
- Compact design
- Superior hygiene
- Easy installation

Standard design
The Alfa Laval SB Anti Vacuum Valve is a flange-mounted safety valve. All product wetted steel parts are made of AISI 316L stainless steel with a surface roughness of Ra< 0.8 μm; all other steel parts are made of AISI 304L stainless steel. All product-wetted seals are made of EPDM and all product-wetted polymers are made of PEEK. The valve is PED 2014/68/EU-compliant and available in two versions: either integrated in a SCANDI BREW® tank top system or mounted on its own counter-flange.

Working principle
The Alfa Laval SB Anti Vacuum Valve is delivered with a counterweight set and locked for an individual opening vacuum to suit the tank or vessel design pressure. When a vacuum in the tank or vessel is lower than the pre-set opening value, the valve opens and lets in atmospheric air.

Cleaning In Place (CIP)
The Anti Vacuum Valve is cleaned, when closed, by the tank cleaning head, but this will not include the valve seating. To include the valve seating in the cleaning cycle, there are two options:

**CIP Kit 1 - Force opener; splash guard**
The valve is force-opened during tank CIP. The cleaning of valve seat is dependent on cleaning jets from the tank cleaning head. Any CIP liquid escaping the tank is contained by the splash guard and drains back in to the tank.

**CIP Kit 2 - Force opener; splash guard; CIP nozzle; CIP closing valve**
The valve is force-opened during tank CIP. The cleaning of valve seat is performed by the CIP nozzle. All CIP liquid from the CIP nozzle is contained by the splash guard and drains back in to the tank.

NOTE: Applying any of above CIP options provides that the tank is pressureless at the moment of force opening the Anti Vacuum Valve.

Options

- **Pos. 1:** Force opener: force-opening during valve seat cleaning
- **Pos. 2:** Splash guard: containing CIP liquid during valve seat cleaning
- **Pos. 3:** CIP Nozzle: for cleaning valve seat
- **Pos. 4:** CIP closing valve: applying CIP liquid
- **Pos. 5:** Proximity sensor: for operation detection
- **Pos. 6:** Welding flange: for installation
- **Heating elements:** for valves exposed to sub-zero temperatures
